

The new Date and Time API is moved to the `java.time` package and the Joda time format is followed.

The classes in the new API are immutable and, hence, thread-safe. The new API contains lots of classes that allow us to have more fine-grained control over our date and time representation.

Below is the list of all the classes in the `java.time` package.

Class Summary	
Class	Description
Clock	A clock providing access to the current instant, date and time using a time-zone.
Duration	A time-based amount of time, such as '34.5 seconds'.
Instant	An instantaneous point on the time-line.
LocalDate	A date without a time-zone in the ISO-8601 calendar system, such as 2007-12-03.
LocalDateTime	A date-time without a time-zone in the ISO-8601 calendar system, such as 2007-12-03T10:15:30.
LocalTime	A time without a time-zone in the ISO-8601 calendar system, such as 10:15:30.
MonthDay	A month-day in the ISO-8601 calendar system, such as --12-03.
OffsetDateTime	A date-time with an offset from UTC/Greenwich in the ISO-8601 calendar system, such as 2007-12-03T10:15:30+01:00.
OffsetTime	A time with an offset from UTC/Greenwich in the ISO-8601 calendar system, such as 10:15:30+01:00.
Period	A date-based amount of time in the ISO-8601 calendar system, such as '2 years, 3 months and 4 days'.
Year	A year in the ISO-8601 calendar system, such as 2007.
YearMonth	A year-month in the ISO-8601 calendar system, such as 2007-12.
ZonedDateTime	A date-time with a time-zone in the ISO-8601 calendar system, such as 2007-12-03T10:15:30+01:00 Europe/Paris.
ZoneId	A time-zone ID, such as Europe/Paris.
ZoneOffset	A time-zone offset from Greenwich/UTC, such as +02:00.

In this lesson, we will look at the `LocalDate` class of the `java.time` package. This class holds only the date part without a time-zone in the ISO-8601 calendar system. It represents a date in ISO format (yyyy-MM-dd).

Let’s look at some of the common use cases that can be solved through this class.

## a) Getting the current date#

We can get the current date by using the static `now()` method in the `LocalDate` class.

```
1 import java.time.LocalDate;
2
3 class DateTimeDemo {
4     public static void main( String args[] ) {
5         // now() method will return the current date.
6         LocalDate date = LocalDate.now();
7         System.out.println(date);
8     }
9 }
```

Run Save Reset

## b) Getting a specific date using of() method#

We can get a specific date by using the static `of()` method in the `LocalDate` class. This method has two overloaded versions.

Each of them is shown in the example below.

```
1 import java.time.LocalDate;
2 import java.time.Month;
3
4 class DateTimeDemo {
5     public static void main( String args[] ) {
6
7         // of(int year, int month, int dayOfMonth)
8         LocalDate date = LocalDate.of(2019, 05, 03);
9         System.out.println(date);
10
11        // of(int year, Month month, int dayOfMonth)
12        date = LocalDate.of(2019, Month.AUGUST, 03);
13        System.out.println(date);
14    }
15 }
```

Run Save Reset

## c) Getting a specific date using parse() method#

We can get a specific date by using the static `parse()` method in the `LocalDate` class. This method has two overloaded versions.

Each of them is shown in the example below.

```
1 import java.time.LocalDate;
2 import java.time.format.DateTimeFormatter;
3
4 class DateTimeDemo {
5     public static void main( String args[] ) {
6
7         // parse(CharSequence text)
8         LocalDate date = LocalDate.parse("2015-02-12");
9         System.out.println(date);
10
11        // parse(CharSequence text, DateTimeFormatter formatter)
12        date = LocalDate.parse("12/02/2012", DateTimeFormatter.ofPattern("MM/dd/yyyy"));
13        System.out.println(date);
14    }
15 }
```

Run Save Reset

## d) Adding days and months to a given date.#

We can use a whole range of addition operation methods that can be used for adding days, weeks, and months to a given date.

```
1 import java.time.LocalDate;
2 import java.time.temporal.ChronoUnit;
3
4 class DateTimeDemo {
5     public static void main( String args[] ) {
6
7         // Adding 4 days to the given date.
8         LocalDate date = LocalDate.parse("2015-02-12").plusDays(4);
9         System.out.println(date);
10
11        // Adding 4 months to the given date.
12        date = LocalDate.parse("2015-02-12").plus(4, ChronoUnit.MONTHS);
13        System.out.println(date);
14    }
15 }
16 }
```

Run Save Reset

## e) Getting day of week#

We can get the day of the week using `getDayOfWeek()` method.

```
1 import java.time.DayOfWeek;
2 import java.time.LocalDate;
3
4 class DateTimeDemo {
5     public static void main( String args[] ) {
6
7         DayOfWeek dayOfWeek = LocalDate.parse("2017-04-06").getDayOfWeek();
8
9         System.out.println(dayOfWeek);
10    }
11 }
```

Run Save Reset

## f) Checking if a date is before or after a given date.#

We can check if a date comes before or after another given date by using the `isBefore()` and `isAfter()` methods.

```
1 import java.time.LocalDate;
2
3 class DateTimeDemo {
4     public static void main( String args[] ) {
5
6         // Using isBefore() to check if the date is before a given date.
7         boolean isBefore = LocalDate.parse("2020-03-12")
8             .isBefore(LocalDate.parse("2018-06-14"));
9         System.out.println(isBefore);
10
11        // Using isAfter() to check if the date is after a given date.
12        boolean isAfter = LocalDate.parse("2020-03-12")
13            .isAfter(LocalDate.parse("2018-06-14"));
14        System.out.println(isAfter);
15    }
16 }
17 }
```
